

USE OF A VITAMIN COMBINATION FOR THE TREATMENT OF PRURITUS
AND NON-INFECTIVE DISORDERS INVOLVING ITCHING
AND/OR INFLAMMATION

ABSTRACT

Use of a combination of two vitamin compounds, i.e. riboflavin (also known as vitamin B₂) and nicotinic acid (also referred to as niacin) or, as an alternative thereto, the corresponding amide, i.e. nicotinamide or niacinamide (also known as vitamin PP) for the systemic treatment of various forms of itching, such as, e.g., pruritus associated with renal insufficiency or failure (i.e. uremic pruritus), and of pruritus forms that are not connected with primary organic affections, as well as for the treatment of a number of non-infective internal affections of a substantially inflammatory nature, such as e.g., urticaria and/or angioedema, asthma, allergic rhinitis and allergic oculorhinitis.
